Weak Systems Have Intractable Theorems

Raheleh Jalali

Problem

Studying the "strengths" of proof systems.

By strength we mean:

- Proof theory: *provability* of a theorem. (Potential proofs)
- Proof complexity: *feasibility* of the proofs. (Actual proofs)

The latter leads to the quantitative study of the proofs: determining the minimal "complexity" of a proof of a theorem in a given "proof system".

There are many different formalizations of the concept of a proof. The basic property: being a proof must be easy to check (polynomial time).

Definition [Cook, Reckhow '79]

Propositional proof system: a poly-time function **P** whose range is the set of all propositional tautologies. If $\mathbf{P}(x) = \varphi$, we call x a **P**-proof of φ .

(Proofs and formulas are encoded as strings in a finite alphabet.)

Examples: The usual Hilbert-style and Gentzan-style proof systems.

Connection to complexity theory

An immediate but fundamental observation:

Theorem

(Cook, Reckhow '79) There exists a polynomially bounded proof system, i.e., a proof system for propositional logic in which all tautologies have proofs of polynomial length, if and only if NP = coNP.

Connection to complexity theory

An immediate but fundamental observation:

Theorem

(Cook, Reckhow '79) There exists a polynomially bounded proof system, i.e., a proof system for propositional logic in which all tautologies have proofs of polynomial length, if and only if NP = coNP.

Proof.

Recall that a proof system P is defined as

```
\varphi \in \mathsf{TAUT} iff \exists y P(y) = \varphi.
```

The set of propositional classical tautologies is *coNP*-complete. On the other hand, if the length of y is bounded by the length of φ , we get NP.

• □ ▶ • 4 □ ▶ • □ ▶ • □ ▶

Conjecture: NP \neq coNP (which implies P \neq NP)

Therefore, we expect that there is no polynomially bounded proof system, i.e., all proof systems have *intractable theorems*.

Program

Separate NP from coNP (and hence P from NP): show super-polynomial lower bounds to the length of proofs in all propositional proof systems.

イロト イ理ト イヨト イヨト

There are exponential lower bounds to the lengths of proofs in several weak classical proof systems such as resolution, cutting planes, and bounded-depth Frege systems.

However, for strong systems, including Frege and extended Frege systems, no such lower bounds have been established.

By proving lower bounds to the lengths of proofs in non-classical proof systems, we separate complexity classes NP and PSPACE, which is supposedly easier than the NP vs. coNP problem. Thereof, we expect to have better results in the non-classical realm.

Confirmation to this intuition:

Theorem (Hrubeš (2007) and Jeřábek (2009))

There are exponential lower bounds for intuitionistic and modal Frege and extended Frege systems.

Unfortunately, and needless to say, the intuitionistic result cannot be used for classical logic, because the formulas have short proofs in classical Hilbert system.

Substructural logics are non-classical logics where some or all the usual structural rules are absent.

Theorem (weaker version)

Let L be a substructural logic such that $L \subseteq IPC$. Then, there exists a sequence of L-tautologies that require exponentially long proofs in any Hilbert-style system for L.

Substructural logics are non-classical logics where some or all the usual structural rules are absent.

Theorem (weaker version)

Let L be a substructural logic such that $L \subseteq IPC$. Then, there exists a sequence of L-tautologies that require exponentially long proofs in any Hilbert-style system for L.

Remark

If a sequence of formulas do not have short proofs in intuitionistic logic, then they will not have short proofs in substructural ones. Is the theorem above a trivial statement?

Substructural logics are non-classical logics where some or all the usual structural rules are absent.

Theorem (weaker version)

Remark

If a sequence of formulas do not have short proofs in intuitionistic logic, then they will not have short proofs in substructural ones. Is the theorem above a trivial statement?

No. These intuitionistically valid formulas may not be provable in substructural logics. And that is the case here.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Consider the following superintuitionistic (si) logics:

$$\mathsf{KC} = \mathsf{IPC} + \neg p \lor \neg \neg p \qquad , \qquad \mathsf{BD}_{\mathsf{n}} = \mathsf{IPC} + BD_{\mathsf{n}}$$

where IPC is the intuitionistic logic and $BD_0 := \bot$ and $BD_{n+1} := p_n \lor (p_n \to BD_n)$.

Theorem (Jeřábek)

A si logic L has infinite branching iff $L \subseteq BD_2$ or $L \subseteq KC + BD_3$.

Frege systems are the most natural calculi for propositional logic.

A (Frege) rule is an expression of the form

$$\frac{\varphi_1,\ldots,\varphi_k}{\varphi}$$

where $\varphi_1, \ldots, \varphi_k, \varphi$ are propositional formulas.

Let **P** be a finite set of rules. A **P**-proof of φ from a set of assumptions X, denoted by $X \vdash_{\mathbf{P}} \varphi$, is $\varphi_1, \ldots, \varphi_m = \varphi$ such that each $\varphi_i \in X$, or is inferred from some $\varphi_j, j < i$, by a substitution instance of rule in **P**. The formulas φ_i are called *lines* of the proof.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Now, we are ready to define Frege systems.

Definition

A finite set of rules, P, is called a Frege system for a logic L when

(1) **P** is strongly sound: if $\varphi_1, \ldots, \varphi_n \vdash_{\mathbf{P}} \varphi$, then $\varphi_1, \ldots, \varphi_n \vdash_{\mathsf{L}} \varphi$,

(2) **P** is strongly complete: if $\varphi_1, \ldots, \varphi_n \vdash_{\mathsf{L}} \varphi$, then $\varphi_1, \ldots, \varphi_n \vdash_{\mathsf{P}} \varphi$.

Example: Hilbert-style systems for classical and intuitionistic logics.

Substructural calculi

$$\begin{split} \varphi \Rightarrow \varphi & \Rightarrow 1 & 0 \Rightarrow \\ \hline \frac{\Gamma \Rightarrow \Delta}{\Gamma, 1 \Rightarrow \Delta} (1w) & \frac{\Gamma \Rightarrow \Delta}{\Gamma \Rightarrow 0, \Delta} (0w) \\ \hline \frac{\Gamma, \varphi \Rightarrow \Delta}{\Gamma, \varphi \land \psi \Rightarrow \Delta} & \frac{\Gamma, \psi \Rightarrow \Delta}{\Gamma, \varphi \land \psi \Rightarrow \Delta} & \frac{\Gamma \Rightarrow \varphi, \Delta}{\Gamma \Rightarrow \varphi \land \psi, \Delta} \\ \hline \frac{\Gamma, \varphi \Rightarrow \Delta}{\Gamma, \varphi \lor \psi \Rightarrow \Delta} & \frac{\Gamma \Rightarrow \varphi, \Delta}{\Gamma \Rightarrow \varphi \lor \psi, \Delta} & \frac{\Gamma \Rightarrow \psi, \Delta}{\Gamma \Rightarrow \varphi \lor \psi, \Delta} \\ \hline \frac{\Gamma, \varphi, \psi \Rightarrow \Delta}{\Gamma, \varphi \ast \psi \Rightarrow \Delta} & \frac{\Gamma \Rightarrow \varphi, \Delta}{\Gamma, \varphi \Rightarrow \psi, \varphi} & \frac{\Gamma \Rightarrow \varphi, \Delta}{\Gamma, \Sigma \Rightarrow \varphi \lor \psi, \Delta} \\ \hline \frac{\Gamma \Rightarrow \varphi, \Delta}{\Gamma, \Sigma, \varphi \to \psi \Rightarrow \Delta, \Lambda} & \frac{\Gamma, \varphi \Rightarrow \psi, \Delta}{\Gamma \Rightarrow \varphi \to \psi, \Delta} \\ \hline \frac{\Gamma \Rightarrow \varphi, \Delta}{\Gamma, \Sigma, \varphi \to \psi \Rightarrow \Delta, \Lambda} & \frac{\Gamma, \varphi \Rightarrow \psi, \Delta}{\Gamma \Rightarrow \varphi \to \psi, \Delta} \\ \hline \frac{\Gamma \Rightarrow \varphi, \Delta}{\Gamma, \Sigma \Rightarrow \phi, \Lambda} & \frac{\Gamma, \varphi \Rightarrow \psi, \Delta}{\Gamma \Rightarrow \varphi \to \psi, \Delta} \end{split}$$

Substructural logics

The language of FLe is $\{0,1,\wedge,\vee,*,\rightarrow\}.$ Uppercase Greek letters denote multisets of formulas.

- FL_e : the single-conclusion version of the rules.
- CFL_e : the multi-conclusion version of the rules.

Remark

Consider uppercase Greek letters to be *sequences* of formulas instead of multisets, i.e., the exchange rule is not present. Then, we introduce two implication-like connectives \setminus and /, and include their respective rules. This system is called **FL**.

The logic FL is defined as the set of all formulas φ such that $\vdash_{FL} \Rightarrow \varphi$. Define \vdash_{FL} as: $\Gamma \vdash_{FL} \varphi$ iff $\{\Rightarrow \gamma\}_{\gamma \in \Gamma} \vdash_{FL} \Rightarrow \varphi$. A *substructural logic* (over FL) is a set of formulas closed under both substitution and \vdash_{FL} .

We have to provide a sequence of formulas provable in $\mathsf{FL}_{\mathsf{e}},$ such that every proof of them are long.

- (Main task) providing a sequence of $\mathsf{FL}_e\text{-}\mathsf{tautologies}$: Change the existing hard intuitionistic tautologies in a suitable way that they become provable in FL_e , but remain hard.
- (Easier part) proving they are hard: Use the canonical translation of the language of FL_e to the language of IPC, i.e., sending {0,1,*} to {⊥, ⊤, ∧}, respectively and the other connectives to themselves. This transformation takes polynomial time.

▲日▼▲□▼▲目▼▲目▼ ヨー ショマ

Hard intuitionistic tautologies

The following formulas, $\Theta_{n,k}$, are hard for IPC and they are negation-free and \perp -free. Small Roman letters denote atomic formulas and the formulas α_n^k and β_n^{k+1} are monotone, i.e., only consist of atoms, \wedge and \vee .

Intuitionistic formulas:

$$\Theta_{n,k} := \bigwedge_{i,j} (p_{i,j} \vee q_{i,j}) \to$$

$$(\bigwedge_{i,l}(s_{i,l} \vee s'_{i,l}) \to \alpha_n^k(\bar{p}, \bar{s}, \bar{s'})) \vee (\bigwedge_{i,l}(r_{i,l} \vee r'_{i,l}) \to \beta_n^{k+1}(\bar{q}, \bar{r}, \bar{r'}))]$$

Hard intuitionistic tautologies

The following formulas, $\Theta_{n,k}$, are hard for IPC and they are negation-free and \perp -free. Small Roman letters denote atomic formulas and the formulas α_n^k and β_n^{k+1} are monotone, i.e., only consist of atoms, \wedge and \vee .

Intuitionistic formulas:

$$\Theta_{n,k} := \bigwedge_{i,j} (p_{i,j} \vee q_{i,j}) \to$$

$$\mathbb{I}(\bigwedge_{i,l}(s_{i,l} \vee s_{i,l}') \to \alpha_n^k(\bar{p}, \bar{s}, \bar{s'})) \vee (\bigwedge_{i,l}(r_{i,l} \vee r_{i,l}') \to \beta_n^{k+1}(\bar{q}, \bar{r}, \bar{r'}))]$$

Theorem (Hrubeš '07, Jeřábek '09)

The formulas $\Theta_{n,k}$ are IPC-tautologies and require IPC-Frege proofs with $2^{n^{\Omega(1)}}$ lines, for $k = \lfloor \sqrt{n} \rfloor$.

・ロト ・ 母 ト ・ ヨ ト ・ ヨ ト

Define the following formulas

$$\Theta_{n,k}^* := \left[\underset{i,l}{*}((p_{i,j} \land 1) \lor (q_{i,j} \land 1)) \right] \rightarrow \left[(\underset{i,l}{*}((s_{i,l} \land 1) \lor (s_{i,l}' \land 1)) \rightarrow \alpha_n^k) \lor (\underset{i,l}{*}((r_{i,l} \land 1) \lor (r_{i,l}' \land 1)) \rightarrow \beta_n^{k+1}) \right]$$

イロト イポト イヨト イヨト 6 September, 2022

590

Define the following formulas

$$\Theta_{n,k}^* := \begin{bmatrix} * ((p_{i,j} \land 1) \lor (q_{i,j} \land 1)) \end{bmatrix} \rightarrow$$
$$\begin{bmatrix} (* ((s_{i,l} \land 1) \lor (s_{i,l}' \land 1)) \to \alpha_n^k) \lor (* ((r_{i,l} \land 1) \lor (r_{i,l}' \land 1)) \to \beta_n^{k+1}) \end{bmatrix}$$

Theorem

The formulas $\Theta_{n,k}^*$ are FL_e-tautologies. Moreover, for any substructural logic L and any superintuitionistic logic of infinite branching M such that FL_e \subseteq L \subseteq M, the formulas $\Theta_{n,k}^*$ require L-Frege proofs with $2^{n^{\Omega(1)}}$ lines, for $k = \lfloor \sqrt{n} \rfloor$.

Raheleh Jalali

Corollary

Let $S \subseteq \{e, c, i, o\}$, and L be FL_S, or any of the logics of the sequent calculi in Table 1. Then the length of every proof of Θ_n^* in any (extended) Frege system for L is exponential in n.

Corollary

Let $S \subseteq \{e, c, i, o\}$, and L be FL_S, or any of the logics of the sequent calculi in Table 1. Then the length of every proof of Θ_n^* in any (extended) Frege system for L is exponential in n.

What happens in the case of the classical versions of the above substructural logics? They are not included in IPC and hence our method does not work. However, for their cut-free versions we have the following theorem.

Theorem

The length of every proof of Θ_n^* in the sequent calculi $CFL_e^-, CFL_{ei}^-, CFL_{eo}^-$, and CFL_{ew}^- is exponential in *n*, where the "-" means without the cut rule.
