 k -potent residuated
lattices

Luca Spada

Introduction

Canonical
formulas

Generalise

Main result

Sketch of
the proof

Main aim

1. We look for *uniform* axiomatisations of all substructural logics.
2. Possibly, with all axioms having a certain *shape*.
3. Possibly, with all axioms within a certain *complexity class*.
4. Possibly, with additional *nice properties* of the axioms.

We achieve this, for k -potent substructural logics, through *canonical formulas*.

the proof

Theorem

There exists a uniform way of axiomatising all k -potent extensions of FL_{ew} such that the axioms have a **common shape**, **bounded complexity**, and a **semantic characterisation**.

Caveats

1. Just in this talk, **residuated lattice** means commutative, integral, residuated lattice.
2. The short-hand k -RL will be often used to mean **k -potent (commutative, integral) residuated lattice**.
3. The methods will freely and informally move from algebra to logic and vice versa.

Intuitionistic
logic

Generalise

Main result

Sketch of
the proof

To every **finite** algebra A , associate a formula $\gamma(A, \dots)$ such that

1. $A \models \gamma(A, \dots)$.
2. There is a relation \mathcal{R} such that for every Heyting algebra B we have

$$B \models \gamma(A, \dots) \quad \text{iff} \quad A \mathcal{R} B$$

Example: Jankov formulas

Canonical
formulas for
 k -potent residuated
lattices

Luca Spada

Theorem (Jankov, de Jongh^δ)

For every finite, subdirectly irreducible Heyting algebra A there exists a formula $\chi(A)$ such that for every Heyting algebra B we have:

$$B \not\models \chi(A) \quad \text{iff} \quad \exists C \quad A \triangleright C \leftarrow B.$$

Luca Spada

Theorem (Jankov, de Jongh^δ)

For every finite, subdirectly irreducible Heyting algebra A there exists a formula $\chi(A)$ such that for every Heyting algebra B we have:

$$B \not\models \chi(A) \quad \text{iff} \quad \exists C \quad A \triangleright C \leftarrow B.$$

- ▶ **Uncountably** many intermediate logics can be axiomatised by these formulas.
- ▶ There are intermediate logics that are **not axiomatisable** by Jankov formulas.
- ▶ Every logic whose variety of Heyting algebras is **locally finite** can be axiomatised by Jankov formulas.

the proof

If $D^\wedge, D^\rightarrow \subseteq B \subseteq A$ are the subsets of pairs of elements on which \wedge and \rightarrow are defined, then the embedding of A into C preserves:

1. \vee and \cdot for all elements of A ,
2. \wedge only for the elements of D^\wedge ,
3. \rightarrow only for the elements of D^\rightarrow .

D-maps

Canonical formulas for k -potent residuated lattices

Luca Spada

The previous slide motivates the following definition:

Definition

Let $D := (D^\wedge, D^\rightarrow)$ be any pair of subsets of A^2 . A D -map between residuated lattices A and B is an injective function $f: A \rightarrow B$ such that for all $a, b \in A$

1. $f(a \vee b) = f(a) \vee f(b)$ and $f(a \cdot b) = f(a) \cdot f(b)$,
2. If $(a, b) \in D^\wedge$ then $f(a \wedge b) = f(a) \wedge f(b)$,
3. If $(a, b) \in D^\rightarrow$ then $f(a \rightarrow b) = f(a) \rightarrow f(b)$,

Notation

$$A \xrightarrow{D} B.$$

Main result

Sketch of the proof

Main steps [Cont'd]

Canonical
formulas for
 k -potent residuated
lattices

Luca Spada

Step 1

- ▶ If $\varphi(X_1, \dots, X_n)$ is not provable in FL_{ew}^k then it fails in the free n -generated k -RL \mathcal{F}_n .
- ▶ Consider the partial subalgebra $\text{Sub}(\varphi)$ of \mathcal{F}_n given by all subformulas of $\varphi(X_1, \dots, X_n)$.
- ▶ Apply Block&van Alten's construction to $\text{Sub}(\varphi)$ and obtain a finite k -RL A .
- ▶ Consider the sets:

$$D^\wedge := \{(\psi_1, \psi_2) \mid \psi_1 \wedge \psi_2 \in \text{Sub}(\varphi)\}$$

$$D^\rightarrow := \{(\psi_1, \psi_2) \mid \psi_1 \rightarrow \psi_2 \in \text{Sub}(\varphi)\}.$$

- ▶ Take all subdirectly irreducible epimorphic images of A that refute φ , $p_i: A \rightarrow A_i$ with $i \leq m$.
- ▶ Consider the triplets $(A_i, D_i^\wedge, D_i^\rightarrow)$ where $D_i^\wedge := p_i[D^\wedge]$ and $D_i^\rightarrow := p_i[D^\rightarrow]$.
